

Fitting notes for Chin-up bars

Pack contents: Chin-up bar

Tools required for fitting:

Digging Equipment

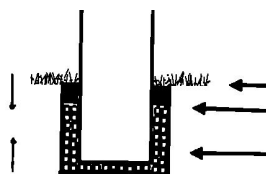

Fixing materials

Before any digging is carried out it is important to make sure there are no existing services buried beneath the desired placement points, i.e. electric, gas, water or drainage pipes. Look for existing manhole covers as a clue.

Always check existing plans for services.

Make sure required gap between other structures and the chin-up bar is maintained on all sides and that an appropriate surface is underneath, for example, wood chip, rubber mats, grass mats or lawn.

Keep the temporary supporting boards on the legs while handling and manoeuvring the chin-up bar until the final height check and fitting. Place the chin-up bar where you wish to site it. With a spade, mark closely around the three legs. Move the chin-up bar to one side whilst digging the holes. Remove turf and place aside for later use.

The holes should be fractionally wider in diameter than the legs and depth required for the age of children, approximately 2ft 2" (65cm).

Remove the temporary boards. Carefully lower the chin-up bar into the holes and make sure it is level. Set in with appropriate materials and reinstate the turf.

For the longevity of the chin-up bars' decoration reapply water-based varnish once every five years, or sooner if necessary.
